Optimised Linking of Dealers

These days, CANTOR Software GmbH are introducing the latest release of their window software CANTOR Professional II - V6.4 to the market – an integrated ERP system covering all aspects of the window and door industry. Apart from a variety of functions that will be introduced at „BAU“ in Munich, CANTOR's programmers have focused on completing the modules

need the user's special attention, and will lock the order in question. Order import is fully automated and requires only a fraction of the time you would need to handle printed orders. Prerequisite for the smooth operation is the synchronisation of the dealer software and the production planning system with regards to program release and

for distributors and resellers, some 2.700 licenses of which are currently being used world-wide. Especially in connection with the fully automated transfer of purchase orders from the distributor program and automatic update, there are new functions which help to optimise the interplay between the manufacturer's production planning system and the dealer's program. When a purchase order is imported into the production planning system, the software will check all technical and commercial details. The software system will mark order items that

base data. CANTOR now offers to all dealers a fully automatic update (data, program, or both) via Internet. This minimises the work connected with the update and still supplies the customers with the latest information – everyone will have the same program release.
